Report on Using GPT for Sports Q&A Tasks

Objective:
The purpose of this experiment was to explore GPT's ability to answer structured sports questions accurately. I created multiple variations using different sports (F1, cricket, football) and tested GPT's responses when asked about winners, runners-up, scores, and Man of the Match or top performers.

Methodology:
- I provided GPT with structured context in a "system → user → assistant" format, giving examples for specific years. For instance, in F1:
- User: "Who won the 2010 F1 championship?"
- Assistant: "Driver: Sebastian Vettel. Team: Red Bull. Points: 256."
- Similar contexts were created for cricket (World Cup winners, runners-up, and Man of the Match) and football (World Cup winners, runners-up, and final score). Queries outside the examples tested GPT's generalization.

What did I learn:
- GPT was very reliable when asked about years included in the context. Responses matched the expected structured answers and maintained formatting.
- When queried for years not in the examples, GPT sometimes hallucinated or gave incorrect information, particularly in cricket and football queries beyond the years we supplied.
- Variations with more structured examples (including Man of the Match and final scores) performed better guiding the model to answer consistently.

Conclusion:
GPT works effectively for structured, example driven sports Q&A tasks. Its reliability decreases when asked about information outside the context. Future implementations should combine GPT's conversational strengths with an external factual database to ensure accurate responses.
